Experiment 4:

Aim

To implement a finite-state-style morphological parser that generates plural forms of English nouns.

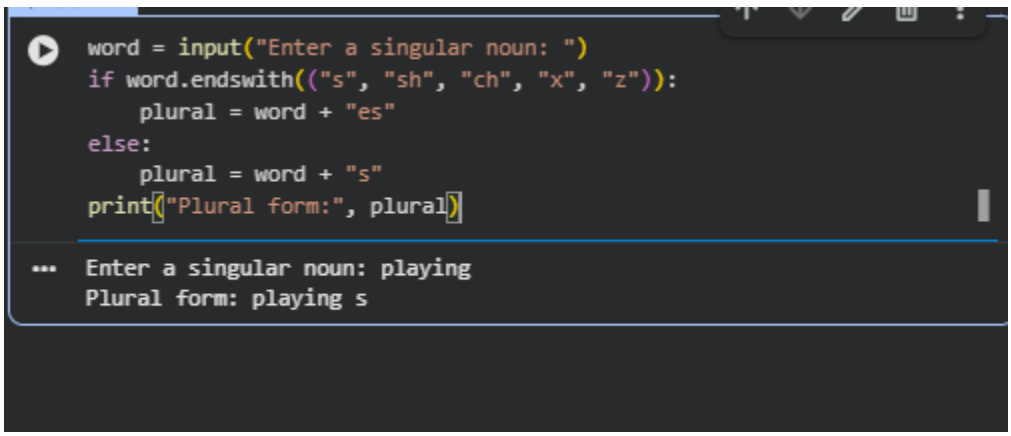

Algorithm

1. Read a singular noun.
2. Check its ending.
3. If it ends in `s`, `sh`, `ch`, `x`, or `z`, add `es`.
4. Otherwise, add `s`.
5. Display the plural form.

Python Program

```
word = input("Enter a singular noun: ")
if word.endswith(("s", "sh", "ch", "x", "z")):
plural = word + "es"else:
 plural = word + "s"
print("Plural form:", plural)
```

Output

Result

Thus, plural forms of English nouns were generated successfully using simple morphological rules.
