Experiment 2:

Aim

To implement a finite state automaton that accepts strings ending with `ab` using Python.

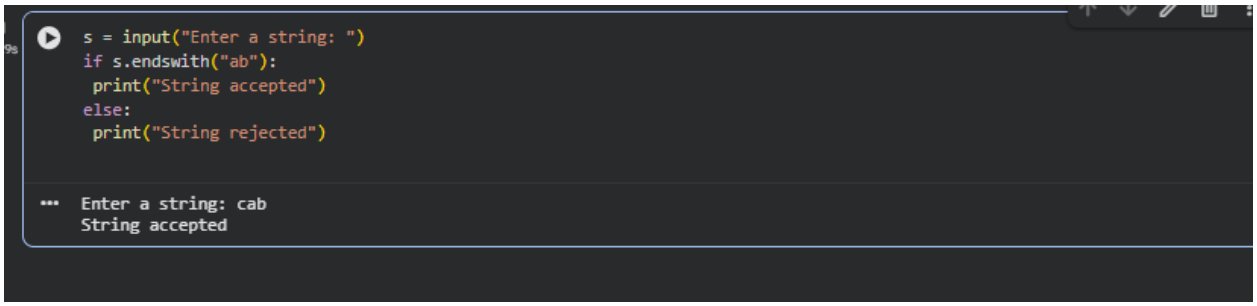

Algorithm

1. Get a string from the user.
2. Check whether the string ends with `ab`.
3. If it ends with `ab`, print “String accepted”.
4. Otherwise, print “String rejected”.

Python Program

```
s = input("Enter a string: ")
if s.endswith("ab"):
 print("String accepted")
else:
 print("String rejected")
```

Output

Result

Thus, the finite state automaton program was successfully executed to recognize strings ending with `ab`.
