Experiment 1:

Aim

To write a Python program using regular expressions to match and search for patterns in a text.

Algorithm

1. Import the re module.
2. Get a text string from the user.
3. Define a pattern to search for.
4. Use re.search() to find the pattern in the text.
5. Display the matched pattern if found; otherwise, display “Pattern not found.”
6. Stop the program.

CODE:

```
import re

text = input("Enter a text: ")

pattern = "Python"

match = re.search(pattern, text)

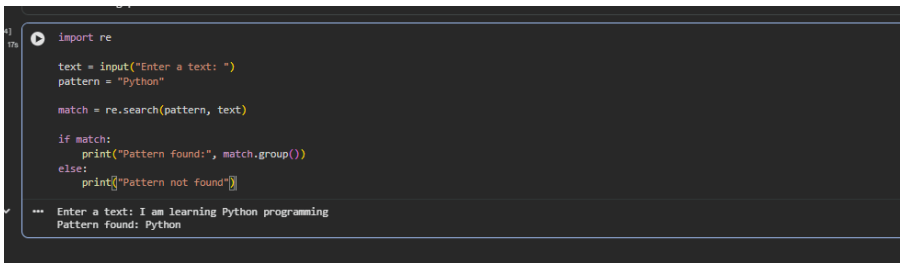

if match:

    print("Pattern found:", match.group())

else:

    print("Pattern not found")
```

OUTPUT:

Result

Thus, the Python program using the `re` module was successfully executed to search for a specific pattern in a given text.
