ASSESSMENT TOOL 3 – CODING CHALLENGE

Course Code:	DSA03	**Course Title:**	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	**Assessment:**	Assessment Tool 3 – Coding Challenge
Weightage:	30% of CIA		
CO5 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	C . Nancy Flora	**Reg. No.:**	192324117
Section / Batch:		**Date:**	

Code of Conduct

I (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student:

Instructions

- Develop a complete and modular Python program that meets all the functional requirements specified in the coding challenge using appropriate algorithms, data structures, and programming practices.
- Test the program using multiple valid and invalid test cases, and clearly display the input, processing, and output to verify the correctness of the implementation.
- Follow standard coding practices by using meaningful variable names, proper indentation, comments, exception handling (where applicable), and upload the source code, sample outputs, and README file to the designated GitHub repository.
- Duration: 40 minutes.

Section / Topic	Focus	Q Nos
Regular Expression Pattern Matching	Regular Expressions, Basic Regular Expression Patterns	1
Finite State Automata Implementation	Finite State Automata, Models and Algorithms	2
Advanced Regular Expression Search	Regular Expressions, Basic Regular Expression Patterns	3

Annexure A – Coding Challenge

Section 1: Intelligent Email and Password Validator using Regular Expressions

1. Problem Statement:

A software company is developing a user registration system. Before creating an account, the system must validate user credentials based on predefined security policies.

Develop a Python application that validates:

Email Address
Password
Mobile Number

using Regular Expressions.

Validation Rules

Email
Must start with an alphabet.
May contain letters, digits, '.', '_' before '@'. Domain should contain only alphabets.
Valid extensions: .com, .org, .edu, .net, .in

Password

Minimum 8 characters
At least one uppercase letter
At least one lowercase letter
At least one digit
At least one special character (@,#,$,%,&,!)

Mobile Number

Must contain exactly 10 digits. First digit should be between 6–9.

Expected Output

Display:

Valid Email / Invalid Email
Strong Password / Weak Password
Valid Mobile Number / Invalid Mobile Number

CODE:

```
import re

# Email validation
def validate_email(email):
    pattern = r'^[A-Za-z][A-Za-z0-9._]*@[A-Za-z]+\.(com|org|edu|net|in)$'
    if re.match(pattern, email):
        print("Valid Email")
    else:
        print("Invalid Email")

# Password validation
def validate_password(password):
    pattern = r'^(?=.*[A-Z])(?=.*[a-z])(?=.*\d)(?=.*[@#%&!]). 8,'
    if re.match(pattern, password):
        print("Strong Password")
    else:
```

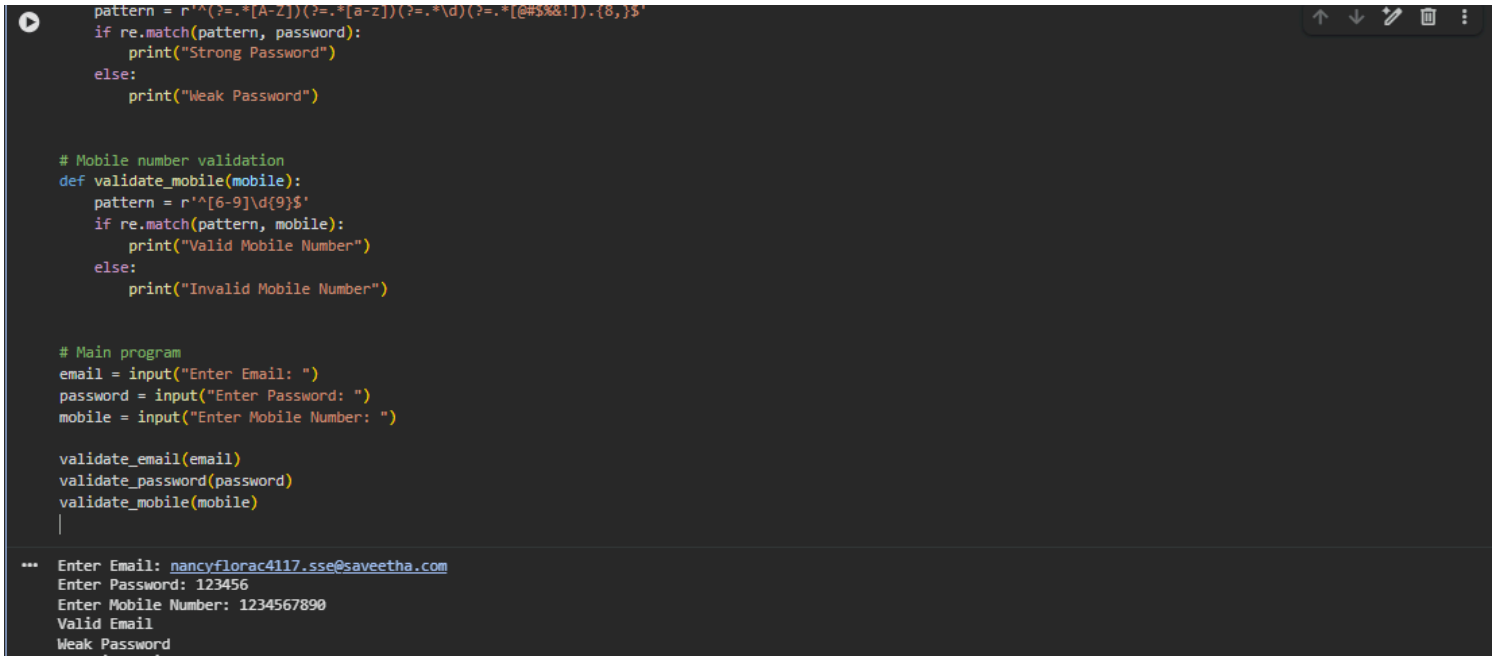

```
        print("Weak Password")

# Mobile number validation
def validate_mobile(mobile):
    pattern = r'^[6-9]\d{9}$'
    if re.match(pattern, mobile):
        print("Valid Mobile Number")
    else:
        print("Invalid Mobile Number")

# Main program
email = input("Enter Email: ")
password = input("Enter Password: ")
mobile = input("Enter Mobile Number: ")

validate_email(email)
validate_password(password)
validate_mobile(mobile)
```

OUTPUT:

Section 2: Design a Finite State Automata (FSA) Simulator

- **Problem Statement**

Develop a Python-based Deterministic Finite Automata (DFA) simulator.

The program should:

- Accept the DFA description
  - States
  - Input alphabet
  - Transition table
  - Initial state
  - Final state(s)
- Accept multiple input strings.
- Simulate state transitions.
- Display whether the string is Accepted or Rejected.

Example

Language:
Strings ending with "ab"

Input
abaab

Output
Transition Path:
q0 → q1 → q0 → q1 → q2
Accepted

CODE:

```
# DFA Simulator

# Enter DFA details
states = input("Enter states (comma separated): ").split(",")
alphabet = input("Enter input alphabet (comma separated): ").split(",")

initial_state = input("Enter initial state: ")
final_states = input("Enter final states (comma separated): ").split(",")

# Create transition table
transitions = {}

print("\nEnter transitions for each state and input symbol:")

for state in states:
    state = state.strip()
    transitions[state] = {}

    for symbol in alphabet:
        symbol = symbol.strip()
        next_state = input(
            f"Transition from {state} on {symbol}: "
        ).strip()

        transitions[state][symbol] = next_state

# Test multiple strings
n = int(input("\nEnter number of input strings: "))

for i in range(n):
    string = input(f"\nEnter string {i + 1}: ")
```

```
current_state = initial_state
path = [current_state]
valid = True

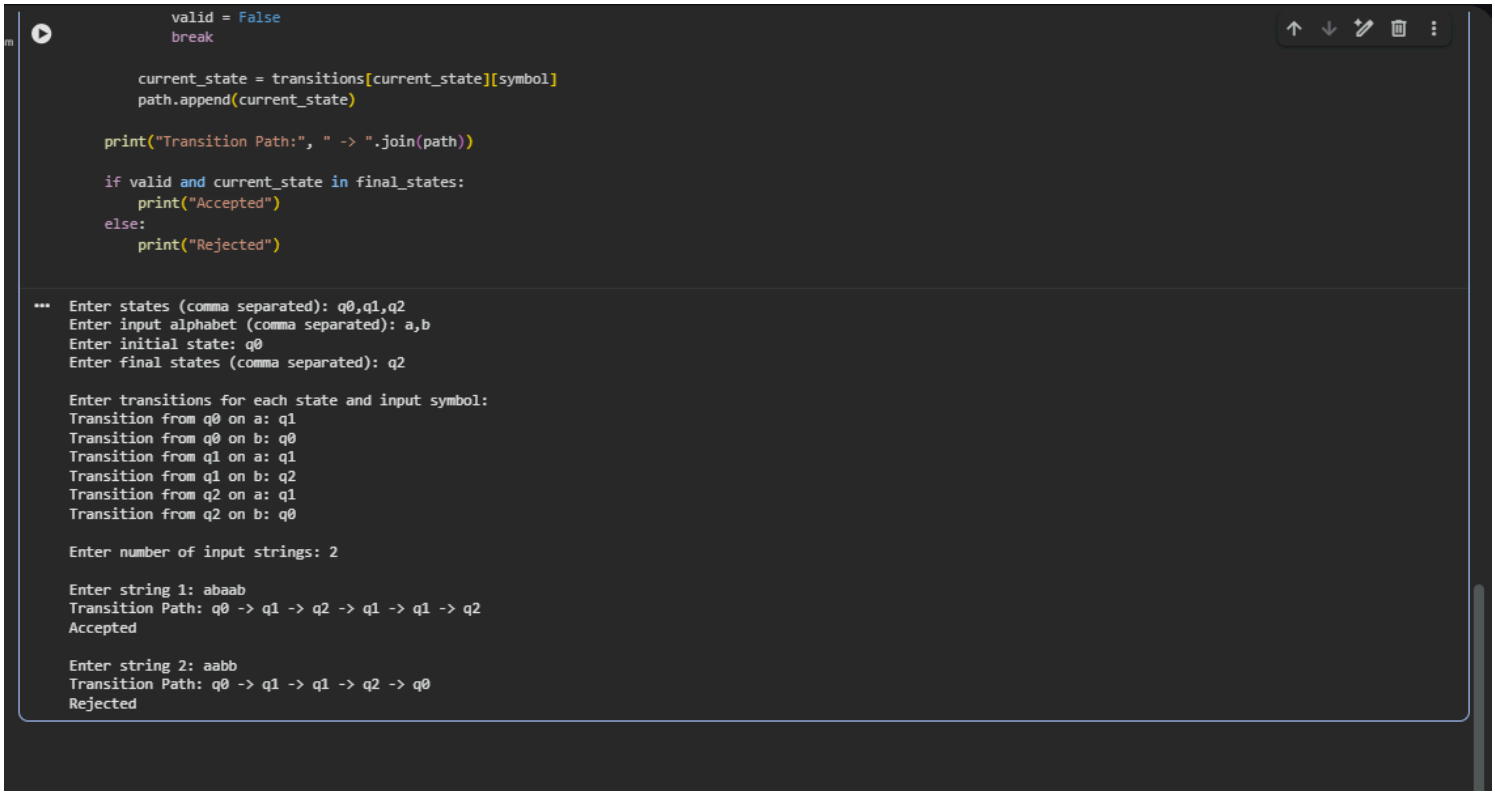

for symbol in string:
    if symbol not in alphabet:
        valid = False
        break

    current_state = transitions[current_state][symbol]
    path.append(current_state)

print("Transition Path:", " -> ".join(path))

if valid and current_state in final_states:
    print("Accepted")
else:
    print("Rejected")
```

OUTPUT:

Section 3: Smart Pattern Matching Engine using Regular Expressions

3. Problem Statement

Develop a Python-based text search engine that performs pattern matching using Regular Expressions.

The system should support:

Word Search
Prefix Search
Suffix Search
Date Search
Phone Number Search
Hashtag Search
Mention (@username) Search

Example Input

Meeting on 12/09/2026
Call 9876543210
#NLP
@OpenAI
natural language processing

User Menu

- Search Date
- Search Phone Number
- Search Hashtag
- Search Mention
- Search Prefix
- Search Suffix

Expected Output

Display all matching patterns based on user selection.

CODE:

```
import re

# Get input text
print("Enter text (press Enter on an empty line to finish):")

lines = []

while True:
    line = input()
    if line == "":
        break
    lines.append(line)

text = "\n".join(lines)

# Display menu
print("\n--- Smart Pattern Matching Engine ---")
print("1. Search Word")
print("2. Search Date")
print("3. Search Phone Number")
print("4. Search Hashtag")
print("5. Search Mention")
print("6. Search Prefix")
```

```
print("7. Search Suffix")

choice = input("Enter your choice: ")

# Word search
if choice == "1":
    word = input("Enter word to search: ")
    pattern = r'\b' + re.escape(word) + r'\b'
    result = re.findall(pattern, text, re.IGNORECASE)

# Date search: DD/MM/YYYY
elif choice == "2":
    pattern = r'\b\d{2}/\d{2}/\d{4}\b'
    result = re.findall(pattern, text)

# Phone number search: 10 digits
elif choice == "3":
    pattern = r'(?<!\d)[6-9]\d{9}(?!\d)'
    result = re.findall(pattern, text)

# Hashtag search
elif choice == "4":
    pattern = r'(?<!\w)#[A-Za-z0-9_]+'
    result = re.findall(pattern, text)

# Mention search
elif choice == "5":
    pattern = r'(?<!\w)@[A-Za-z0-9_]+'
    result = re.findall(pattern, text)

# Prefix search
elif choice == "6":
    prefix = input("Enter prefix: ")
    words = re.findall(r'\b\w+\b', text)
    result = [
        word for word in words
        if word.lower().startswith(prefix.lower())
    ]

# Suffix search
elif choice == "7":
    suffix = input("Enter suffix: ")
    words = re.findall(r'\b\w+\b', text)
    result = [
        word for word in words
        if word.lower().endswith(suffix.lower())
    ]

else:
    result = None
    print("Invalid choice")

# Display results
if result is not None:
```

```
if result:
    print("\nMatching Patterns:")
    for item in result:
        print(item)
else:
    print("No matching patterns found.")
```

OUTPUT:

```
        prefix = input("Enter prefix: ")
        words = re.findall(r'\b\w+\b', text)
        result = [
            word for word in words
            if word.lower().startswith(prefix.lower())
        ]

    # Suffix search
    elif choice == "7":
        suffix = input("Enter suffix: ")
        words = re.findall(r'\b\w+\b', text)
        result = [
            word for word in words
            if word.lower().endswith(suffix.lower())
        ]

    else:
        result = None
        print("Invalid choice")

    # Display results
    if result is not None:
        if result:
            print("\nMatching Patterns:")
            for item in result:
                print(item)
        else:
            print("No matching patterns found.")
```

```
Enter text (press Enter on an empty line to finish):

--- Smart Pattern Matching Engine ---
1. Search Word
2. Search Date
3. Search Phone Number
4. Search Hashtag
5. Search Mention
6. Search Prefix
7. Search Suffix
Enter your choice: 1
Enter word to search: natural
No matching patterns found.
```

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Problem Understanding	20%	Clearly understands problem constraints, edge cases, and competitive requirements	Understands problem with minor gaps in constraints	Partial understanding; misses key constraints	Misinterprets problem or constraints
Algorithm	25%	Selects optimal algorithm with best time and space complexity for competitive constraints	Uses efficient algorithm with minor scope for improvement	Uses basic/inefficient approach	No clear algorithmic approach
Code Implementation	20%	Writes correct, efficient, and clean code that passes all constraints	Code works with minor errors or inefficiencies	Partially correct code; fails for some cases	Code does not execute or gives incorrect results
Competitive Performance	20%	Solves problem within time limits and handles large inputs effectively	Solves within acceptable time with minor delays	Struggles with time limits or larger inputs	Unable to solve within time constraints
Test Case Handling	15%	Handles all test cases including edge and hidden cases	Handles most test cases	Misses important edge cases	Fails on multiple test cases

Q. No. / Criteria	Problem Understanding	Algorithm	Code Implementation	Competitive Performance	Test Case Handling	Sub. Total	Total %
