Experiment 3:

Aim

To perform basic morphological analysis on words using the NLTK library in Python.

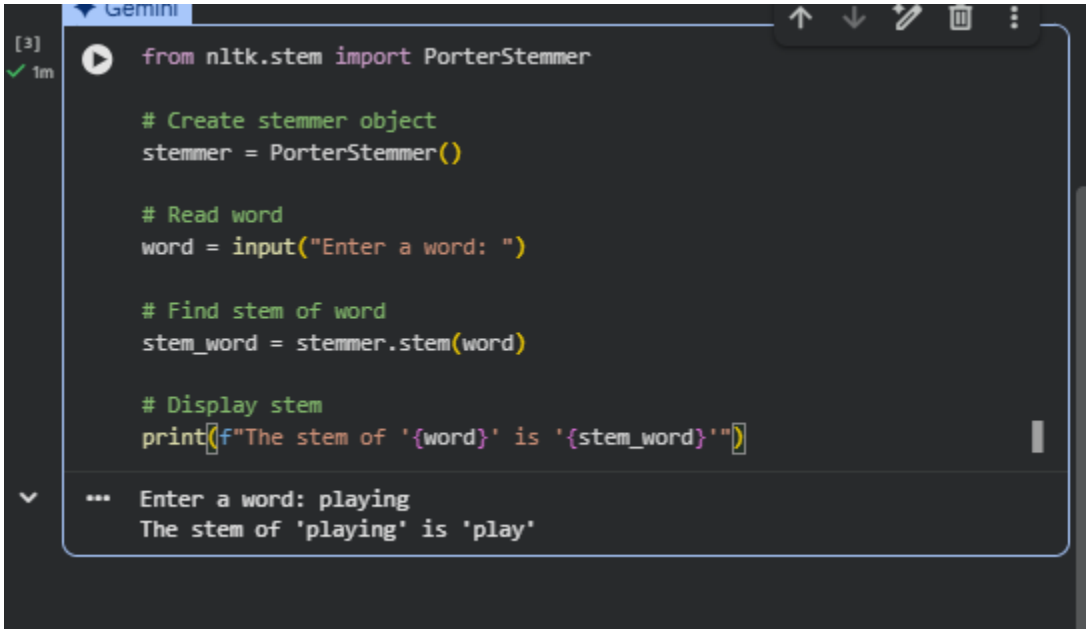

Algorithm

1. Import `PorterStemmer` from NLTK.
2. Create a stemmer object.
3. Get a word from the user.
4. Find the stem of the word.
5. Display the original word and its stem.

Python Program

```
from nltk.stem import PorterStemmer
ps = PorterStemmer()
word = input("Enter a word: ")
print("Original word:", word)
print("Stem:", ps.stem(word))
```

Output

Result

Thus, morphological analysis was performed successfully using NLTK to identify the stem of a word.
